1 System requirements

1.1 CADbro System Requirements

| **Operating System** | CADbro  
Microsoft® Windows 10  
Recommended system: Windows 10 Version 1909 or Windows 10 Version 20H2  
**Tip:**  
The 32-bit Windows operating system is not supported by CADbro since version CADbro 2023. |
| **Processor** | Intel Pentium ® 4(@2GHz or above), or equivalent AMD® processor, or equivalent AMD® processor |
| **GPU** | Support Microsoft DirectX® 9 and above or OpenGL 3.1 and above graphics cards  
Recommended configuration: NVIDIA GeForce GTX1050 Ti or NVIDIA GeForce GTX 1650 |
| **RAM** | Minimum configuration: 2G  
Recommended configuration: 8G or above |
| **Virtual memory** | Minimum configuration: 1G  
Recommended configuration: 2G or above |
| **GB** | Minimum configuration: 4G free disc space  
Recommended configuration: 8G or above free disc space |
| **Video** | Minimum configuration: 1024 x 768 VGA with True Color  
Recommended configuration: 1280×1024,1680×1050,1920×1080 VGA with True Color or above |
| **Pointing device** | Three-button mouse, trackall or other device. |
| **Required for licensing** | Soft Key |
| **Required for Floating License** | Installation of TCP/IP Network Protocol |
| **CD-ROM** | Any speed (for installation only) |

2 Softkey activate

2.1 Stand-alone Version

2.1.1 Activation

If you wish to operate CADbro with full functions, it must be activated. Activation needs a soft key, if you do not have a Soft Key, please contact the local dealer from whom you purchased CADbro.

Please follow these steps to activate CADbro online:

1. On the desktop, double-click the CADbro 20XX icon.

2. You can see the activate interface.
3. Enter the Activation ID (Soft Key) in the text box and press the **Verify** button. If the Activation ID is used the first time, the user needs to enter your information. Click **Activate**. The activation will be successful after a few seconds.

4. Click **OK** to close the successful activation message, and back to the license manager.

5. Click **Ok** to close the license manager dialog box, and **CADbro** will be restarted to get the license.
In the case of no Internet connection on the local computer, you can activate CADbro through procedures illustrated as follows:

1. On the desktop, double-click the **CADbro 20XX** icon.

2. In the Online Activation dialog box, click the **click here** to go to offline activation dialog.
3. In the Offline Activation dialog box, fill in the Activation ID (Soft Key) and Generate a Request XML File. Save the file onto the local computer.
4. Go to another computer with an Internet connection and use the Request XML File to obtain a corresponding Response XML File via E-mail or Online Self-Service

a) Option 1: E-mail
You may send the generated Request XML File to the ZWSOFT License Center at register@zwcad.com. The ZWSOFT License Center will send you the corresponding Response XML File as soon as possible.

b) Option 2: Online Self-Service:
   (1) Go to the ZWSOFT License Center at http://license.zwsoft.com/zw3dCustomer.aspx and Login with the Activation ID (Soft Key).

   (2) Choose **Activate** or **Manage Entitlements**, and then click **Manual Activation**.
(3) Click **Browse** to import your Request XML File, and then click **Submit**.

(4) Then you will be able to see the information of the corresponding Response XML File. Please save the file onto the local computer.
5. Click **Browse** to import the Response XML File, and then click **Activate**. The following message will be shown as follows after the successful activation.

6. Click **OK** and back to the license manager.
7. Click **Ok** to close the license manager dialog box, and **CADbro** will be restarted to get the license.
2.1.2 **Returning a License**

Please follow these steps to return CADbro License online:

1. **Launch License Manager** as follows
   a. On the Windows taskbar, click the **Start** button.
   b. Choose **All Programs** (or **Programs**). (Operation system is win7 or win 8 need to choose **ZWSOFT** folder first).
   c. Choose **CADbro20XX** and then click **the License Manager**.
2. Select the license to return, click **Return**.
3. Click **Online** and the message will be shown. Read the message carefully.
4. Click **OK** to return, the license will be successfully returned in a few seconds.

Please follow these steps to return CADbro License **offline**:

1. Launch **License Manager** as follows
   a. On the Windows taskbar, click the **Start** button.
   b. Choose All Programs (or Programs). (Operation system is win7 or win 8 need to choose ZWSOFT folder first).
   c. Choose **CADbro20XX**, and then click **License Manager**.
2. Select the license to return, click **Return**.
3. Click **Offline** and the message will be shown. Read the message carefully.

4. Read the message carefully. Follow the steps described in the figure.
5. Press the **Generate** button to generate a Request XML File. Save the file onto the local computer.
6. Go to another computer with an Internet connection and use the Request XML File to obtain a corresponding Response XML File via E-mail or Online Self-Service

a) Option 1: E-mail

You may send the generated Request XML File to the ZWSOFT License Center at register@zwcad.com. The ZWSOFT License Center will send you the corresponding Response XML File as soon as possible.

b) Option 2: Online Self-Service:

(1) Go to the ZWSOFT License Center at http://support.zwcad.net:8888/flexnet/operationsportal/logon.do and Login with the Activation ID (Soft Key).

(2) Choose Return or Manage Licenses, and then click Manual Return.

(3) Click Browse to import your Request XML File, and then click Submit.
(4) Then you will be able to see the information of the corresponding Response XML File. Please save the file onto the local computer.

7. Press the **Return** button to import the Response XML File, and then click **OK**.
The following message will be shown as follows after the successful return, and the license is disabled in your current computer and available to be activated again.

![Message]

Return Response XML File has been handled, return successfully!
2.2 Network Version

2.2.1 Network License Manager Installation

Please follow these steps to install the Network License Manager:

1. Double-click the ZWSOFT_NetworkLicenseManager.exe to start the installation.
2. Do the following actions on the installation interface:
   - Select the language version to be installed, click the language button to specify target language from drop-down list;
   - Specify the installation location for ZWSOFT Network License Manager. Use the default path, or click Browse to choose another;
   - Read the End User License Agreement carefully, and check Read and Accept.
3. Click Install Now to start installing.
4. The installation wizard prompts Installation Completed.
5. Click **Launch** button to start Network License Manager;
6. Click **Done** button to close installation wizard.

**TIPS**: If a low-version network license manager is installed, you will be reminded whether to update the product.

### 2.2.2 Activating License Server

Activate the License Server by Network License Manager. Please follow these steps to activate the License Server:

1. Click **Start** → **All Programs** → **ZWSOFT Network License Manager** → **Network License Manager** to open the **ZWSOFT Network License Manager** page.
2. Click **Activate License** to enter the **Activate License** page.

You can switch list mode or chart mode through the button in upper right corner.
3. Choose one of the activation type below.

- Online Activation
- Offline Activation

2.2.2.1 **Online Activation**

If you have access to Internet, you can directly send the Activation ID to ZWSOFT Products Authorized Server to activate the license server. This is the most continent way for activation.

**STEPS:**

1. Input your Activation ID and License quantity on Online Activation page, and then click Activate to activate the product.
2. After successful activation, the following prompt is displayed. Click **Done** to return to the home page of **ZWSOFT Network License Manager**. Otherwise, you can contact with ZWSOft Registration Center.

### 2.2.2.2 Offline Activation

If there's no Internet, you can generate an activation request file by activating with Activation ID, send the request file to ZWSOft Registration Center, or login onto ZWSOFT Products Self-Service Activation Platform to get the activation file, and then activate license server by the
response file.

STEPS:

1. Input your **Activation ID** and **License quantity** on Offline Activation page. Click **Generate**, and then specify a path that you want to save the activation request file in the pop-up **Save as** dialog box.

   (1) Select **With Activation ID**, input your activation ID, select a language and then click **Login**.
   (2) Click **Manage Entitlements**.
   (3) Select the wanted product, and then click **Manual Activation**.
   (4) Click **Locate** to import the activation request file generated on Step 1 and then click **Submit**.
   (5) Save your response file by clicking **Save To File**, and then exit the ZWSOFT Products Self-Service Activation Platform.

3. Click **Browse** to import your response file obtained on Step 2 in the **choose response file** dialog box, and then click **Activate** to activate your product.
2.2.2.3 Configuring License Server

You should configure License Server so that you can distribute network licenses to workstations. At first, you need to determine which server model you want to use.

4. After successful activation, the following prompt is displayed. Click **Done** to return to the home page of **ZWSOFT Network License Manager**. Otherwise, you can contact with ZWSOft Registration Center.
• **Single license server mode**

The Network License Manager is installed on one server, so license management and activation is restricted to this server.

Because all license management takes place on a single server, there is only one administration spot and one failure spot. However, if the single license server fails, ZWSOFT products cannot run until the server comes back to work again.

The ZWSOFT Network License Manager will automatically set the configuration during installation, and you can confirm or set it through the Network License Configuration.

**STEPS:**

1. **Click Start → All Programs → ZWSOFT Network License Manager → Network License Configuration** to open the ZWSOFT Network License Manager page.

    | NOTE | If your ZWSOFT products server is installed on Microsoft Windows 7 and Microsoft Windows Vista, please use an administrator account to run it for the first time (Check Start → All Programs → ZWSOFT → ZWSOFT Network License Manager → Network License Configuration, right-click and then select Properties → Compatibility → Check "Run as administrator"). Otherwise, the product cannot be activated normally.

    | NOTE | Since version 11.14.1.3, both Windows xp and Windows 2003 are no longer supported by Network License Configuration(lmtools.exe). Check out the version of the application as follow: right click lmtools.exe file in the installation folder and select Properties in the context menu to open lmtools Properties dialog box, see File version in Details tab.

2. **Click the Service/License File tab.** In this tab, the **Configuration using Services** and **LMTOOLS ignores license file path environment variables** options are checked by default.

3. **Click the Config Services tab** to confirm the configuration.
Configuration instructions are as follows.

- In the **Service Name**, you can set the service name to manage the license. The default service name is **ZWSOFT Network License Manager**.
- In the **Path to the lmgrd.exe file**, specify the license manager daemon file (lmgrd.exe) path; You can enter it directly or click **Browse** to specify the file path (the default path is `C:\Program Files\ZWSOFT\ZWSOFT Network License Manager\lmgrd.exe`).
- In the **Path to the license file**, specify the path of license file (LicenseFile.lic). You can enter it directly or click **Browse** to specify the file path (the default path is `C:\Program Files\ZWSOFT\ZWSOFT Network License Manager\LicenseFile.lic`).
- In the **Path to the debug log file**, specify the path of debug log (LicenseFile.lic). You can enter it directly or click **Browse** to specify the file path (the default path is `C:\ProgramData\ZWSOFT\ZWSOFT Network License Manager\License.log`).

**NOTE**

To avoid of a launch failure of Network License Manager, the recommended path of the log file is either the default path (`C:\ProgramData\ZWSOFT\ZWSOFT Network License Manager\License.log`) or the installation path (`C:\Program Files\ZWSOFT\ZWSOFT 2022 Network License Manager(TS)\ENU\sample.log`). The log file name is editable.

- **Use Services** is checked by default.
- **Start Server at Power Up** is checked by default, and lmgrd.exe will be started automatically on system startup.
- Click **FlexNet Licensing Service Details** to display the detailed version of **FlexNet Publisher**.
4. Click **Save Service** to save your configuration and click **Yes** to confirm your operation.

**NOTE**
If the log file is saved in the installation folder or in any other customized path, after clicking Yes, it will display a pop-up dialog box with the prompt "Windows preferred path <SystemDrive>\ProgramData to store service data is not set.". You can ignore this and continue saving the configurations by clicking **OK**.

5. Choose **Control Panel → Administrative Tools → Services**, right click on the Name of the desired service, and select **Properties** in the context menu.

6. Display **ZWSOFT Network License Manager** Properties dialog box, switch to **Log On** tab, click **Local System account**.

**NOTE**
To avoid of a launch failure of Network License Manager, please do not omit step 5 and step 6.

7. Go to **Start/Stop/Reread** page, click **Start Server** to start service, or click **ReRead License File** to refresh Network License Manager with your license file or optional file changes.

2.2.3 Returning Network License

This feature is used for license transferring and product upgrading. If you want to transfer the license from the original computer to another one or upgrade your products under the condition that some licenses have been activated, the license from the original computer must be returned first before re-obtaining the authorization.

2.2.3.1 Stop License Server

Make sure to login with administrator to use the Network License Configuration.

STEPS:

1. Click Start → All Programs → ZWSOFT Network License Manager → Network License Configuration.

2. Choose Configuration using Services from the Service/License File tab of Network License Configuration, and select the service name of the license server you want to stop manually.

3. Switch to Start/Stop/Reread tab and click Stop Server to stop the license server.
4. Shut down Network License Configuration.

2.2.3.2 **Online Return**
Return the license to "ZESOFT Products Platform License Server" directly by Internet.

**STEPS:**
1. Click **Start → All Programs → ZWSOFT Network License Manager → Network License Manager** to open the **ZWSOFT Network License Manager** page.

2. Click **Return** to enter the **Return License** page, and select **Online Return**.
3. Click **Return**.
4. After successful return, it will return to the ZWSOFT Network License Manager page.

2.2.3.3 Offline Return

If there's no Internet, you can generate a return request file on your computer first, and then send the request file to ZWSOFT Registration Center, or login onto ZWSOFT Products Self-Service Activation Platform to get the return file.

STEPS:

1. Click Start → All Programs → ZWSOFT Network License Manager → Network License Manager to open ZWSOFT Network License Manager page.
2. Click **Return** to enter the **Return License** page, and select **Offline Return**.
3. On the offline return wizard page, click **Generate** and specify a path that you want to save the return request file in the pop-up **Save as** dialog box.

   (1) Select **With Activation ID**, input your activation ID, select a language and then click **Login**.

   (2) Click **Manage Licenses**.

   (3) Select the Fulfillment ID you want to return, and then click **Manual Return**.

   (4) Import your return request file generated on Step 3, and then click **Submit**.

   (5) Click **Save To File** to save your response file.

5. Click **Browse** to import your response file obtained on Step 4 in the **choose response file** dialog box, and then click **Return**.
6. After successful return, it will return to the ZWSOFT Network License Manager page.

2.2.4 Repairing Network License

In case that the license is destroyed by the unusual situation such as virus infection or special hardware changes before returning license, the repair option will be available in the License Manager.

2.2.4.1 Online Repair

Repair the damaged network license directly via the Internet.

STEPS:

1. Click Start → All Programs → ZWSOFT Network License Manager → Network License Manager to open the ZWSOFT Network License Manager page.
2. Click Repair to enter the Repair License page, and select Online Repair.
3. Click Repair.

4. After successful repair, click Done to return to the ZWSOFT Network License Manager page.

2.2.4.2 Offline Repair

If the computer cannot connect to the Internet, the network license can be repaired offline.
STEPS:

1. Click **Start** → **All Programs** → **ZWSOFT Network License Manager** → **Network License Manager** to open the **ZWSOFT Network License Manager** page.

2. Click **Repair** to enter the **Repair License** page, and select **Offline Repair**.

3. On the offline repair wizard page, click **Generate** and specify a path that you want to save the repair request file in the pop-up **Save as** dialog box.

(1) Select **With Activation ID**, input your activation ID, select a language and then click **Login**.

(2) Click **Manage Licenses**.

(3) Select the Fulfillment ID you want to return, and then click **Manual Repair**.

(4) Import your repair request file generated on Step 3, and then click **Submit**.

(5) Click **Save To File** to save your response file.

5. Click **Browse** to import your response file obtained on Step 4 in the **choose response file** dialog box, and then click **Repair**.

6. After successful repair, click **Done** to return to the **ZWSOFT Network License Manager** page.

### 2.2.4.3 Remove the Damaged License

You can also directly remove the damaged network license and then reactivate it.

**STEPS:**

1. Click **Start** → **All Programs** → **ZWSOFT Network License Manager** → **Network License Manager** to open the **ZWSOFT Network License Manager** page.
2. Click **Remove** and prompt "Are you sure to remove the license?". Click **Yes** to return to the **ZWSOFT Network License Manager** page.

3. Write to support@zwcad.com to contact ZWSOFT to return the damaged license. **NOTE** This step is necessary. Remove the license on the machine, the used node is still occupied in the background, if there are no other unused nodes in the activation code, the license server cannot be directly reactivated.

4. Follow the steps to activate the license server again, refer to the help: Activating License Server.
2.2.5 **Borrow Manage**

You can configure which clients are allowed to borrow the licenses, thereby facilitating the borrow management of clients.

The following is an example of steps to configure the clients that are allowed to borrow the license on the license server:

**STEPS:**
1. Click **Start → All Programs → ZWSOFT Network License Manager → Network License Manager** to open **ZWSOFT Network License Manager** page.
2. Click **Borrow Manage** to enter the **Borrow Manage** page.

3. To add a client in the **Borrow Whitelist** area, click **Add**.

   **NOTE** If both the server and the client are using IPv6 address, you need to input the client name or its IPv6 address.
4. Enter the client name or IP address you want to add in the text box, and click Add. After successfully adding, click OK, and click Done.
You can also click Bulk Import to import client name or IP address from a txt or csv file.
Example of .txt file:
   computer 1, computer 2, 192.168.100.13, 192.168.100.14
Example of .csv file:
5. The client will be displayed in the whitelist.

![Borrow Manage](image)

6. If you want to add another client, please repeat the steps above.

<table>
<thead>
<tr>
<th>NOTE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. If whitelist mode is off, all clients are allowed to borrow. Once enabled, only clients in whitelist are allowed to borrow.</td>
</tr>
<tr>
<td>2. For any changes to take effect, please launch Network License Configuration, and click ReRead License File on Start/Stop/Reread tab.</td>
</tr>
</tbody>
</table>
3 Basic knowledge

3.1 **Start CADbro**

Click the CADbro icon from the desktop

Or Start-> Program->CADbro

The interface below when you first start **CADbro**
3.2 **Interface introduction**

1. Function area
2. File list
3. Quick toolbar
4. Manager area
5. Filter toolbar
6. File Browser
7. ViewCube

![Interface diagram](image-url)
3.3 Open a new file

File-> Open

3.4 File Browser

Using the File Browser can quickly locate the directory and add your frequently-used folder to as Favorites.

List windows can list different file formats and quick search the specified file by name.

1-> Favorites and Recent files

2-> Disk directory

3-> File list windows
4 Manager

4.1 Part Browser

Part Browser used to list all the entities belong to the part, like solid, surface, wireframe and so on, you can uncheck the checkbox to hide the entity or right-click the folder to erase, hide or show all.

![Part Browser Image]

4.2 Assembly manager

Assembly manager used to manage the whole assembled structure, all the subassembly, components can be list here, then right-click on the specified component, more functions will be support.
4.3 View manager

View manager used to manage all the view angle, section view, custom view and also the PMI.
4.4 **Visual manager**

Visual manager used to customize the display status, like open the shadow, switch on/off the coordinate or datum plane, setting up the open edge on/off, even the color or thickness.

![Visual manager screenshot](image)

4.5 **Export manager**

Export manager support to predefine your exporting configuration, like exporting the file format to a specified folder, it can be saved as configuration, after that, you can put the current 3d model from graphic window to run this task.

![Export manager screenshot](image)
5 Convert files

Open: Open all the supported files in CADbro, including the Z3D file.
Import: Import all other files into current Z3D. It will not create a new Z3D file.
Quick Import: Quick import supports importing a new Z3D file and only showing its display data, which is faster than the normal type of import. However, there is no Nurbs data, which means that editing this kinds of imported model is limited.

If you want to load the Nurbs data, just click “Load current model” or “Load all model” in the right-click menu of the components or the top-assembly.
Multi-Import:
Multi-Import the third-party format files (ACIS, Catia V4, Catia V5, UG/NX, Proe/Creo, Inventor, SolidEdge and Solidworks) and autosave those files to .Z3D files.

Save: Direct save the current Z3D file.
Save as: Except for saving the current Z3D file, you can save the whole file to any other files.

Export: Compare to Save As, Export command support to select specify shape or component
from the current file to export. Even can make a filter to include or exclude by Layer, Geometry type and Attribute.

**Multi-Export**: Using the default exporting setting to export files to multiple file formats at one time. Users can select the files and objects to export on the **Select Object** page.

On the **Export Settings** page, you can specify the destination and select formats to export.
Chapter 5 Convert files

![Image of Multi-Export window with various file formats and options for folder selection and export settings.]
6  View

6.1  View Angle

Click different View icon to change the view angle

<table>
<thead>
<tr>
<th>Isometric</th>
<th>Top</th>
<th>Bottom</th>
<th>Left</th>
<th>Right</th>
<th>Back</th>
<th>Front</th>
<th>Auxiliary</th>
<th>Align with Plane</th>
<th>Align with Direction</th>
</tr>
</thead>
</table>

**Align with Plane:**
Click this command then select one plane, the view will change to auto-align this plane

**Align with Direction:**
Define the origin point, Up direction and Right direction to customize the view angle

How to save the View angle and reuse it later?
Click the View manager, then right-click the Custom View -> New, then you can save current view angle
6.2 View

Analyze:

Combination: This display mode is used for assemblies when you want to display components in different display modes. Like the assembly model below, each component can show in different display modes.

6.3 Visibility

6.4 Display Mode

Analyze: Display the previous face analyze status

Combination: This display mode is used for assemblies when you want to display components in different display modes. Like the assembly model below, each component can show in different display modes.

Note: To set the different components to different display modes, you can right-click the component >Display>then select your needed display mode.
6.5 **Screen**

Display a multi-window screen, each window size can be dragged to change the size.

![Screen options](image)

6.6 **Windows**

The list method for all open files.

![Windows options](image)

6.7 **Rotation**

Rotate the 3D model around the X/Y/Z axis. Users can also define a specific axis by **Lock any axis** for rotation.

![Rotation options](image)
7 Selection

Pick control: Control the input field, picking or unpicking. You can also call the pick control by a right mouse button click on the graphic window.

Pick Rule: Control the picking behavior

>Normal Pick is the default picking behavior, which means when you Left mouse click the entity, it will auto be selected but the previous picking entity will be removed, you can hold Ctrl key to achieve Add picking or unpicking.

>Add Pick means always add the selected entity to the input field by clicking the left mouse button.

>Del Pick means always remove the selected entity by clicking the left mouse button.

Pick Scope: The window pick behavior, for example, it means all the entity in the windows frame will be selected.

Pick from list: When there are multiple legitimate objects under the current mouse position, you can switch different object choices through “Pick from list” option from right-click menu. Or use the shortcut keys Alt (cannot be released) + right clicking (continuously): traverse and pre-highlight (pre-selection) the legal objects under the current mouse location and left click the mouse when pre-highlight some entity to confirm the current selection.
8  Tools

8.1  Dimension

New style dimensions can be created by the following tools, which are always parallel to the view window.

The final effect is shown below.

8.2  Curve creating

CADbro offers curve creating tools to create the wireframe that includes the Line, Polyline, Circle, Rectangle and so on.
8.3 Attribute

**Line attribute:** Use to change the color, style, and width of next creating curve

**Face attribute:** Use to change the face color, or you can select face set or shape body first then click this command

For face attribute, the most often used is the Face color and Transparency

You can also find the command from the Quick toolbar as below.

**Material attribute:** Use to change the shape or part materials, which allow you to select the existed material from the list or add your new material.
**Part attribute:** Use this form to define attributes assigned to the active part. Use this dialog box to define properties for active parts, supporting standard attributes, user-defined attributes, and physical attributes. For Import/Export/Edit in Excel.
8.4 Section

Planar Section:

Use this command to dynamically section the active part or assembly. Completing this command will create section curves in the active part and the active component in an assembly. It can also be used as a visual aid to dynamically clip away portions of the part to view features that might normally be hidden from view.

The required inputs include the section plane and offset distance. Optional inputs include multiple sections (copies at distance intervals) and using the section plane as the first copy.

Section:

Required

This command allows you to set specific characteristics of the section view that is enabled when Section View Display Mode is activated.
**Display control**

**Sectioned shape** - support two buttons, one is the default option to hide the sectioned part, another button to show the sectioned part with a wireframe.

**Interference** - support to specify the interference color.

**Hatch color** - allow to use part color or specify a color for the hatch.

**Hatch style** - support three buttons here, the first one is the switch off, the second and third one is the different hatch style.

**Spacing** - is offset value of the hatch style

**Opaque** - can drag the slider to change the transparency percent of the hatch

**Align with section plane** - can align the current model to the section plane

**Display Interference** - Switch on/off the interference checking for the section view

**Display section planes** - Switch of/off the section plane

**Display hatch for non-closed shapes** - Whether creating the hatch for the open surface, that’s not perfect solid with a gap or missing face

**Move handle only** - Only moving the dynamic moving handle when dragging, that will not move the section plane position.
**Section Curve**
CADbro supports to display the section curves with extra window, working on the extra window, you can rotate the section profile even export it to DWG/DXF/IGES and STEPS.

**Insert**
CADbro supports to insert datum and curves into the current model.

**Component**
CADbro supports to exclude and include some specified components on the section curves window.

8.5 **Capture**

**Capture:**
Use this command to capture the active display to a file. It automatically turns off the view extents readout, the world axis triad, and the default datum display. You can save to bmp, gif, jpg, and tiff graphics file formats. It also allows up to the maximum pixel resolution supported by your graphics card.

**Screenshot:**
This command will use window pick to select the area to capture, which can be stored at the clipboard so that you can paste to any other application like Word or Excel, what’s more, you can save to file or choose a different background color.
8.6 **Assist**

**Datum Axis**

Use this command to insert a new datum axis. The attributes of the datum axis include one orientation, an origin and the length.

**Datum**

Use this command to insert a new datum plane, which can be used to create a 3D curve or used to be a section plane.

**Datum CSYS**
Use this command to insert a new CSYS, which consists of three axes, three datum planes and one origin.

**Frame**
Frame can be used to create a local frame, which can be used to recalculate the coordinate dimension.

**Stock**
Use this command to create an extruded stock feature that completely encloses a single face, an entire shape or a block. The required inputs include the shape(s) to enclose and a reference plane to orient the stock. By default, the size of the stock equals the extents of the shape.

**Hole**
Use this command to create a simple hole in CADbro.

### 8.7 Mode

**2D Sheet**
Use this command to go to 2D Sheet environment.
9 Analyze

9.1 Measure

Measure:

This command can base on the selected entity to generate the measurement result, which can be also recorded and attached in the model and minimize the label.

Distance:

This command measures 3D distances at the Part Level. You can measure points, geometry, and planes. Remember that you can select more input options. Refer to each method and options below.
**Angle:**

This command measures 3D angles at the Part Level. You can measure points, geometry, and planes. You can select from a variety of different geometry types to measure from. Using the RMB (right mouse button) provides even more options to choose from.

**Arc:**

Use this command to select points and display arc data such as radius, included angle, center, and normal. You can use this command to check the radius of a 3D arc, curve or edge as shown in the figure or to check the theoretical arc data for three random points.

**Length:**

Use this command to inquire about the length of a line, arc, curve, or edge. You can also inquire about a length summation by selecting multiple items to measure. In the sketch, the external curves can be captured to inquire.

1) Select a line, arc, curve, or edge to measure. The length appears in the Current Curve field.

2) Select another line, arc, curve, or edge or move. Move the cursor over additional items. The new length and total length for each is displayed in the Last Curve and Summation fields.

3) Click OK to close the form.
Area:
Use this command to inquire about the area of an enclosed planar 3D or 2D region. The following information is displayed in the Inquire Area Properties Form (shown below). Refer to the 3D and 2D procedures below.

3D Surface:
Use this command to inquire about an arbitrary 3D planar area enclosed by boundary curves. The boundary curves may consist of 3D/2D curves, partial or whole sketch and/or trace profiles, edges or curve lists. All boundary geometry must lie on the same plane.

9.2 Inspect Entity
**Coordinate:**

Use this command to display the location of a point measured in specific X, Y, Z coordinates.

**Curve Info**

Use this command to inquire curve information on any line, arc, curve, or edge.

**NURBS data**

Use this command to inquire the NURBS data of a line, arc, curve, or edge.

**Control Polygon**

Use this command to display the control polygon of a curve. This refers to the line segments that connect adjacent control points of a curve. The control points are the set of points that are saved by the system and used mathematically to define the curve. You can apply this command to the active part to another component in an assembly or sub-assembly from the active part.

**Curvature Plot**

Use this command to display the curvature plot of curves or edges. The plot is displayed as line segments projecting out perpendicular from the curves. The length of each line segment illustrates curvature at that point on the curve. This command helps to visualize overall curvature across a curve or edge.

**Param Space Partition**

Use this command to display the parameter space of a curve. Point markers at each point on a curve associated with a knot value are displayed along with the normalized parameter and arc length values at each point. This helps you determine how close the curve is to arc-length parameterization. This echo relates to the existing curve. Use the Cubic Refit Curves command to echo this information for a resulting refitted curve. You can apply this command from the active part to another component in an assembly or sub-assembly.

**Analyze Faces**

Use this command to analyze faces for surface imperfections, draft angles, curvature, and other
surface characteristics. The analysis results are presented in a variety of plots superimposed on the active part. This command switches the Graphics Window to Analyze display mode and leaves it in that mode when the command terminates. Use the View menu or the Toolbar’s display mode button to switch to another display mode when the analysis results are no longer needed.

**Surface curvature**

Use this command to inquire about the curvature of a face where it passes through a specified point. By default, the point lies on the face. You can use the **Face** option to select a different face to analyze. By default, a direction that is normal to the face through the specified point is used to "slice" the face for curvature analysis. You can also select a different direction if desired.

**Continuity Error**

Use this command to analyze the tangent continuity across two mating faces at a selected edge. The edge must be shared by both faces. The results displayed are the maximum and average error measured in degrees. You can also check for C0 continuity (gaps) along the edge by selecting **Position** from the **Continuity** option.

### 9.3 Inspect Model

**Mass Properties**

Use this command to calculate and display mass properties information (e.g., volume, area, mass, etc.) for a selected shape (open or closed), component, or the entire assembly. Blanked and/or suppressed components in an assembly will be ignored during these calculations. (Surface) The area is the only value that can reasonably be relied on for an Open Shape. A warning message is prominently displayed letting you know that you have selected an Open Shape.

**Part Interference Check**

To clearly understand the interference between shapes, user can use this command to check the interference status between shapes.
10 PMI

10.1 Manager

After creating PMI notes, you can go to the View manager as below to activate different views to create PMI, move or copy PMI from one view to another view, what’s more, you can control the PMI visibility by using the manager.

10.2 Dimension

Use to create different 3d dimension types as below.
10.3 Annotation

Use to add different 3D annotations on the model.

10.4 Text

Simple text and the text with balloon

10.5 Tools

This command is used to preset all PMI attributes, including the dimension style, text style, etc.
Resize PMI

When creating a PMI note, it will generate a different note sizes base on a different view, this command can reset the global PMI size to match all notes.

Regen PMI

This command uses to do regeneration for PMI, if you want the PMI to be refresh or update, you can use this command to do that.
11 Healing

11.1 Checking

Heal/Analyze
This command analyzes and attempts to repair abnormal conditions relating to the geometry of entities (e.g., vertex points, edge curves, UV curves, face boundaries - refer to the figures above) that defines the topology of the active part. Such conditions include gaps between face edges and coincident vertices.

Show Open Edges
Use this command can quick check the open edges one by one. Use the arrow button you can jump to previous or next one, use Zoom to the window will zoom to the current open edge to display.

Check Edge
This command checks and/or delete tiny edges whose curve lengths are smaller than a specified
tolerance and that are not required to define the topology of the active part. This command will attempt to bring the encountered conditions within the current Geometry Tolerance setting. Select the edges to check/delete or middle-click for all edges.

**Fit Plane**

Use this command to check and fix planar faces.

### 11.2 Healing

**Sew**

Sew the open edge face to be merge one.

**Explode**

Explode the selected face set to be multiple faces.

**Sew Edge’s Gap**

This command attempts to sew a gap that exists between two sets of face edges. After selecting the two sets of edges, CADbro will extend the two faces to try to determine curves of intersection. If intersections are found, the faces are trimmed to the new intersection curve which then becomes the new shared edges. If multiple edges are selected for each set, it is best that they form a closed loop.

If the faces will not intersect when extended, then a medial curve located between the edges is projected onto each face and then each face is trimmed. This will not close the gap but will make the two edges more closely aligned with each other. This operation is limited to working on open faces. Therefore, you must first explore the faces and then sew them. Refer to the optional Edge Cv input below.

You can also select two sets of edge curves. A checkbox is provided to enable this option.
**Close Gaps**

This command is designed mainly to handle imported geometry to attempt to sew gaps that exist between shared face edges. After selecting the edges, **CADbro** will extend the faces to try to determine curves of intersection. If intersections are found, the faces are trimmed to the new intersection curves which then become the new shared edges. If multiple edges are selected, it is best that they form one or more closed loops.

If the faces will not intersect when extended, then a medial curve located between the edges is projected onto each face and then each face is trimmed. This will not close the gap but will make the two edges more closely aligned with each other. This operation is limited to working on imported open faces. Therefore, do not sew the faces before using this command.

**Fill Gap**

This command fills open gaps between faces. The gaps must be bordered by a closed loop of open edges. If the edges are not coplanar, a ruled face is created. If the edges are coplanar, a planar face with trim loops is created.

**Reverse Direction**

Use this command to reverse the normal direction of faces or shapes. Direction arrows will appear indicating the current direction of the face or shape.
12 Edit

12.1 Direct Edit

DE Move

Use these commands to move face. Various methods are supported including directions, points, and frames.

Align Move Face

Use this command to align move face by using 3D constraints. The constraints include coplanar, concentric, tangent, parallel, perpendicular, at angle and symmetric.

- **Motion face**
  
  Select a face to move.

- **Stationary**
  
  Select a stationary object. The motion face will keep the specified constraint with this object.

- **Angle**
  
  This field is available if the constraint is **At angle**. Set the angle between the motion face and the stationary object.

- **Symmetry plane**
  
  This field is available if the constraint is **Symmetric**. Specify the symmetry plane between the motion face and the stationary object.
**Dim Move Face**

Move face by dimension, which supports linear and angular dimensions.

**DE Face offset**

Use this command to offset one or more faces of a shell. This command extends or trims faces as needed during the offset operation to close gaps and resolve intersections.

**DE Draft**

This command creates a draft feature about selected faces.

**DE Copy**

Use these commands to copy face. Various methods are supported including directions, points, and frames.

**DE Mirror**

Use this command to mirror the selected faces.

**DE Pattern**

Use this command to pattern the selected face.
**Modify Fillets**

Use this command to modify the selected fillet.

**Modify Radius**

Use this command to modify the radius of cylinder and sphere.

**Modify Holes**

Use this command to modify the hole without re-generation history.

**Replace**

Use this command to replace one or more faces of a solid or shape with another face or shape or datum plane.

**Simplify**

Use this command to simplify a part by removing selected faces. The command will attempt to extend and reconnect faces to close the resulting gaps in the part. If the part cannot be closed properly an error message will be returned. Select the faces to remove and then middle-click to remove them.

Alternately, you can also delete or blank the features that contain the faces.
12.2 Shape transform

Shape transform commands support to move, copy mirror and scale the selected shapes.

12.3 Part transform

Part transform commands support to move, drag, mirror and rotate the selected component. Compare to shape transform, the target entity type is different. One for shapes, one for components.
13 Mark up

Create new comment

Create a new comment will list on the manager as below

Right-click the comment you will see the list below, you can change the setting, save the comment to Z3DM file, rename or erase it.

Setting

With setting command, you can add more information for the comment, even change the font style like text font, line thickness, and color.
Apply changes to:

- **All comment in this environment**: Will change all comments
- **Current comment**: Only affect the current comment, this option only available when you right-click a comment and use the setting.
- **New comments**: Will affect the new creating comment, but not the existed comments.

**Open markup**

Open the saving comment file, which is Z3DM file.

**Save markup**

Save all comments or select one of them to save.

**Text with leader**

Create the label text with a leader.
Only create the text without a leader

Insert the extra image.

Create the linear dimension as below

Create the angular dimension as below.
Insert the stamp to the screen
14 Pro

14.1 Assembly

CADbro provides many tools to work with components within an assembly. You can check for interference, blank a component or inquire component properties. You can also set the regen status of each component individually and clone parts. Refer to the topics below.

Interference Check

Use this command to check the interference between components. Please note that the suppressed components in an assembly will be ignored during these calculations. The following steps show how to use this command.

Step 1: Select the component to be checked. If you leave it blank, the whole assembly will be checked.
Step 2: Define the check scope and other options according to the needs.
Step 3: Click “Check” button to calculate, and the results will be listed in the dialog.

Below are the explanations of the options of this command.

Scope Options
➢ Only among the picked
Only check the interference among the selected components.

➢ With other components
Check the interference among the selected components, and meanwhile, check the interference among the selected components and other components.

Other Options

➢ Include shapes within the assembly
Check this option, the interference between the picked components and shapes will be checked.

➢ Check among shapes
Check this option, the interference among all the shapes will be checked.

➢ Treat subassembly as a whole
Check this option, the interference between the subassemblies will not be checked.

*Note: This option is only available when the selected components contain subassemblies.*

➢ Ignore hidden shapes and components
Check this option, the hidden parts and components will be ignored.

➢ Save interference geometry
Check this option, you can save the interference shapes in the history list.

➢ Non-interfering components
This option is to define the display mode of the *non-associated components*, including “Hidden”, “Transparent”, “Shade” and “Wireframe” modes.
Clearance Check

Use this command to check the clearance among components. The following steps show how to use this command.

**Step1:** Select the components to be checked. If you leave it blank, the whole assembly will be checked.

**Step2:** Set the clearance value.

**Step3:** Define the scope of clearance check.

**Step4:** Click “Check” button to get the results.

There will be 3 possible results:

- **Contact:** The distance between the components is 0mm.
- **Interference:** There is interference between the selected components.
- **Distance value:** The distance between the components is more than 0mm but less than the pre-set clearance value.

Below are the explanations of the options of this command.

- Check clearance between components and shapes
- Check sub-assembly internal parts clearance
- Ignore hidden shapes and components
- Unrelated components

This option is the same as the “Non-interfering components” option in the “Interference Check” command.

- Output check results

Click this button to export all clearance results to an Excel sheet.
**Compare Parts**

Use this command to compare two parts and show the differences between them. CADbro provides two methods for comparison, solid compare and face compare. This command supports selecting the Z3D file from the local disk without opening in CADbro.

**Solid Compare**

Select the part file as below, then click the Calculate button.

Below is the compare result, which shows the different regions; you can also change the color and the transparency and hide the regions.
**Reset:** Reset all the settings for display, color, and transparency.

**Save file:** Save the comparison result as Z3D or other neutral formats.

**Save report:** Generate a comparison report.
Face compare
Select the part file as below, then click the Calculate button.

Below is the calculating result, which shows the unchanged faces, changed faces and unique faces, you can also change the transparency and hide the faces.

Click the Save button to generate the compare report.
Exploded View

Use this command to create exploded views for each assembly configuration. This command provides a list to record every explosion step, in which you can re-order the existing steps by drag-dropping the picked step.

Add Exploded Step

CADbro added “Move exploded” “Rotate exploded” and “Radial exploded” in “Add Exploded Step” command to meet user’s requirement of more complex exploded view including complicated path, display path and entirely exploded of sub-assembly.

Meanwhile, CADbro added “Record moving turn point” and “Add trails” to enrich the exploded path. Besides, the option of “Select subassembly part” has achieved different exploded needs.

Check “Record moving turn point” to record the current position, and then perform exploded steps in other directions. The final one will be a complex and continuously multiple exploded paths.
Check "Select subassembly part" to explode the entire subassembly of the currently selected object, which can satisfy the request of the whole assembly explosion and finally get the designed explosion result.
Check “Add trails” option to record exploded trail with double dots line while creating an exploded view.

**Auto Explode**

We added “Auto Explode” to increase the efficiency of creating exploded view, which achieves to create batch component exploded view in uniform. The options “Explode subassembly part” and “Add trails” can achieve different exploded needs.
Add Exploded Trail

To solve the problem that user did not record exploded trial and continued to add exploded trial in follow-up, CADbro can manually add exploded trial in exploded view through defining start and end position so to reach exploded trail creation.

If the option “Along XYZ” is checked, the created trail shall be along the axis of the orthogonal.
Auto Exploded Trail

Used “Auto Exploded Trail” command to improve the efficiency of exploded trail creating. In addition to batch create exploded trails, the function also provides the method to select the start and end of the trial, which achieves the addition to different exploded trails.

- The trail can set the bounding box center.
- The trail can set the component origin.

Reuse Exploded View

Use “Reuse Exploded View” command to raise the efficiency of multiple exploded view. The created exploded view should be applied in the current exploded view, which meet the combined application of complex exploded view.

If the option “Add trails” is checked, the reused exploded view will carry with the exploded trails.
Exploded View Video

Use this command to convert the picked exploded view from the lists to generate an AVI video.

3D BOM

Use this command to generate BOM table of all components of the assembly parts.

- **Level Display Settings**

  **Top-level only:** Select this item to display only the top-level components.

  **Parts only:** Select this item to display only parts.

  **Indented:** Select this item and indent it by assembly level.

  **Shape only:** Select this item to display only the shapes.

- **Include shape & Update calculated attributes**

  **Include shape:** Click on the "Include shape" button, and the 3D BOM will display the shape information.

  **Update calculated attributes:** Click on this button, update all the calculated attributes in the 3D BOM table.

- **Search Function**

  Select an attribute and enter the required value to search the corresponding content in the 3D BOM table.

  **Exact search:** When using exact search, only the component information which coincides with the search content will be displayed as the search results. After entering the content to be searched but not clicking the button to start, the component information containing the search content will be highlighted.

  **Filter search result:** Display the search results according to the preset filtering conditions.
● **Export Data**

**Export format:** The current form of 3D BOM is output as a template, and the template is saved as .Z3DBOMTT format.

**Export data:** Export the current 3D BOM content to EXCEL.

● **Column**

All the optional attributes of the 3D BOM are displayed in the column tab, including system attributes and user attributes.

**Attribute:** Attribute is the corresponding name in the system and can not be modified.

**Descriptive Name:** The descriptive name is the corresponding name in 3D BOM and can be modified.

**Include:** Check the checkbox and the selected attributes will be displayed in the 3D BOM.

**Total:** Check the checkbox and the selected attributes will display total row in 3D BOM.

**Add user attribute:** Users can add user attributes whose types include string, Boolean, integer, numbers, and date.
14.2 Mold

Align

This feature is used to realign geometry after data is imported. Click to enter the interface.

Shrink

This command is used to define a product's shrinkage.

Region

The command according to the regularity of mold structure can quickly review all the surface properties of the model. In Auto Define, selecting a product model and determine the opening mold direction (default is z-axis). System will automatically analyze and get different colors according to different parts of a mold, which distinguishes between core and cavity easily. System goes into Manual Define when completing automatically. Users can view the analysis results under regional options. In this interface, users can change their mold structure to satisfy the design needs so as to provide basis for future mold design. The core and cavity areas have been defined when the Undefined Faces show zero.

Project Silhouette to Plane

Use this command to project the shape silhouette to a plane. You can control to display the outer loop of silhouette only or all curves of it.
**Project Shape to Plane**

Use this command to project the shape silhouette to a plane, and the result is face. You can control to display the outer loop of silhouette only or all loops of it.

**Draft**

Use this command to analyze faces for surface imperfections, draft angles, curvature, and other...
surface characteristics. (See Chapter 5.2 Inspect Entity-> Analyze Faces)

Thickness Analysis

Use this command to analyze the thickness of parts and help users to estimate whether the design is correct.

Undercut Analysis

Use this command to analyze whether there are any undercut faces in the model. It can assist users to estimate where to set sliders or other systems. Besides, it can also help users to select appropriate operation and clamping method, in order to create a complete tool path for machining. After defining the detect direction (parting direction or cutter axis direction), CADbro will automatically color the whole part.

Tips:
- For mold analysis, it should check on the “include negative direction”.
- For CAM analysis, it should not check on the “include negative direction”.

Height Analysis

Use this command to detect all the plane parallel to a specified datum, and list them in the table. It is easy for the user to find out the important plane and calculates the plane numbers.

Tips:
Height analysis cannot be used in assembly.

Height Analysis Result

This command is used to record the result of the last time Height analysis. In this mode, the user can view the part with colors, and add PMI or annotation in those faces.

Tips:
Before Height Analysis, the command will be gray out.
15 HelpDesk

**User Folder Manager**

Use this command to manage the user folder. In this command, user can clear “auto output files”, “custom configurations”, “template files” or “user folder”. If user want to save/load configuration, please click “Save current configurations” or “Load backup configurations”.

**About**

Use this command to check the information about CADbro. In this page, you can view the Version, VERNUM, OS Version, Graphics Card, OpenGL Version, User Folder, Program Folder and license information.
Video Learning
Use this command to link to the CADbro video learning website.

Mail
Use this command to send an email to CADbro service team.

Report Bug
Use this command to report errors to CADbro service team. When using this function to send reports, the system automatically sends files and computer system information to the CADbro service team.
16 2D Drawing

Using the 2D Sheet command from tool ribbon

CADbro can automatically generate a 2D view as below. Location, projection angle and different layouts can be changed.

Working with 2D Drawing, you can create a simple dimension and draw 2D entities manually.

Standard View

Use Standard View to create a standard orthographic layout view from a 3D part. Steps are as below:
**Step1:** Pick the Standard View command.
**Step2:** Select the object from a file.
**Step3:** Pick a view type.
**Step4:** Set the detailed parameters like scale and label.
**Step5:** Place the standard view on the work area.
**Projection View**

Use Projection View to create a view projected from another existing 3D layout view. Steps are as below:

**Step1:** Pick the Projection View command.

**Step2:** Select an existing view to generate the projection view.

**Step3:** Set the detailed parameters.

**Step4:** Place the projection view on the work area.
Auxiliary View

Use Auxiliary View to create an auxiliary view that is projected perpendicular from an edge of another layout view (referred to as the base view). Steps are as below:

**Step1:** Pick the Auxiliary view command.

**Step2:** Select an existing view to generate and choose a line for alignment.

**Step3:** Place the Auxiliary view on the work area.
**Full Section View**

Use Full Section View to create a fully sectioned views base on a 3D layout view. Steps are as below:

**Step1:** Pick the Full Section view command.

**Step2:** Select an existing view to generate the section view.

**Step3:** Define the section line.

**Step4:** Place the section view on the work area.
Use Detail View to create circular and rectangular detail views from another 3D layout view.

**Step1:** Pick the Detail View command.

**Step2:** Select an existing view to generate a detail view.

**Step3:** Define the area you want to zoom in on.

**Step4:** Place the detail view on the work area.

**Step5:** Set the detailed parameters.
Crop View

Use Crop View to create a partial view by trimming a drawing view with a defined boundary.

**Step 1:** Pick the Crop View command.

**Step 2:** Select the crop type and pick an existing view to generate the crop view and define the boundary.
17 Cloud service

17.1 Create a cloud service account

Before using cloud service, you need to sign up an account for CADbro cloud service. Please follow the below steps to create a CADbro cloud service account.

2) Click “Sign up” in the upper-right corner.
3) Input your country/region, email address, verification code and password.
4) Click “Sign up” and then the system will send you a verification mail.
5) Login your mailbox to finish the account verification.

17.2 Personal space management

CADbro Cloud will give each user an online storage space of 100 Mb capacity for free to experience the cloud service. And users can check the basic information (capacity and personal setting) and manage the uploaded files.
17.3 **Team space management**

After creating a CADbro cloud service account, we can create a team with cloud service license to manage the files by projects and start project collaboration.

17.3.1 **Create a team**

To create teams, you need to purchase a cloud service license. Creation procedure is as below:

1) Click “Create” in the upper-left corner.
2) Input your team name, cloud service license, and team description.
3) Click “Submit” to finish.
Notice: When the team is created successfully, the account creating it will become the super manager of the team. The super manager will have the permission to:

- change team settings such as the team name, description and reset the team
- invite members to join the team or remove members from the team
- create projects
- assign roles (manager, member and visitor) to members
- manage all the files in the projects

17.3.2 Invite members to a team

There are two methods for super manager to invite members to join the team.

**Email:** Send an invitation email to members. The members who are invited need to accept the invitation via email.

**URL:** Generate invitation urls in CADbro cloud and send to the members to be invited. The invited members need to load the URL for acceptance.
17.3.3 Create a project

The super manager can create projects, assign roles to members, distribute storage capacity and share links of projects. In team collaboration, model files can only be stored in projects.

17.3.4 Add members to a project

Super manager or manager can add members to a project.
17.3.5 **User roles**

Super manager or manager can assign different user roles to project members. **Manager** has the permission to change project settings, and manage members and files in projects, including uploading/updating models, creating share links for models, and viewing models. **Member** has the permission to upload/update models, create share links for models, and view models. **Visitor** is only allowed to view models.

17.3.6 **File management**

After creating projects and assigning user roles, super manager, project manager and member can view, share, delete and restore files via web or client. *Note: Uploading is only supported in desktop client currently.*
File share
Steps for creating a share link.

1) Click icon near the file to be shared.
2) Set the sharing options, such as expiry date, password, view times and so on.
3) Click “Submit” to finish.

Management of shared files
In Shares tab, users can copy share link and password (if there is), modify the share options, cancel sharing, and view the current usage of the shared files.
➢ **Sharing methods**

You can share files via links or QR codes.

![Sharing methods](image)

➢ **File history**

Click 📚 icon to invoke the History list which records all the operations on the current files, e.g. create, edit and update to a newer version.

![File history](image)

➢ **Delete/Restore files**

Click ┐ icon to delete any files in the project. The deleted files will be stored in the Recycle Bin temporarily. Users can restore the file or delete them permanently.

17.4 Collaboration

Members in the same project can use collaboration function in the CADbro to share the views, annotations and chat in real time. Starting the collaboration session requires you to login CADbro Cloud and upload a file first.

17.4.1 Login CADbro

Steps for logging in CADbro Cloud in desktop client

1) Launch CADbro.
2) Go to the “Start” toolbar, and click Login command.
3) Input your account and password to login.

17.4.2 Upload models

Open the file in CADbro, click Upload File command and select a project it will be uploaded to. Note: CADbro will convert the model into light-weight format (.z3ds) and upload it to the Cloud server.
17.4.3 Start collaboration

Steps for starting collaboration:
1) Choose a model from a project and right-click it.
2) Select "Collaboration".
3) Input a name for the collaboration.
4) Select members to join the collaboration.
5) Describe the collaboration if needed.
6) Click “OK” to start the collaboration.
17.4.4 Operations in collaboration

In collaboration, users are allowed to share views, annotations and chat in real time.

1) **Add Members** 📚
   Click this icon to add new members to the current collaboration.

2) **Sync Switch** 🔑 & ⏯️
   Click these icons to pause/continue the Sync.
3) **Part State Share**

   Click this icon to show the current state of the part to newly-joined members.

4) **Leave Collaboration**

   Click this icon to leave the current collaboration.

   *Note: The controller must hand over the controller right to another member before successfully leaving the current collaboration.*

### 17.4.5 Playback

System will record all the operations during the collaboration and save them to the collaboration folder. A playback record will be helpful to the ones who didn’t attend the collaboration or the ones who want to review the collaboration process. Below are steps to review the playback record.

**Step1:** Find the target collaboration in Space > Collaboration.

**Step2:** Right-click the collaboration and click “Entry” to enter the playback environment.

**Step3:** Review the playback record. There are many options for users’ better experience.

### 17.4.6 View 3D models in browser

By loading the share links, users can open models in a web browser. They can:

- View 3D models
- Check assembly structures
- Show or hide components
- Check explosive view
- View by sections
Chapter 17 Cloud Service

- Measure
- Move components
- .......

And if there is pre-defined exploded view in ZW3D or CADbro desktop version, you can view it in the browser as below:
18 Filter

Filter is important to control the select entity from the graphic window.

The pick filter list shows the entity types that the active command prompt is looking for. The list is displayed when the pick filter icon is selected (see above) or when (Shift) key and the right mouse button (RMB) are selected together. When you select an entity type from the list, only those entities can be selected or highlighted. You can pick the Attributes button (when displayed) to filter by additional attributes.

Holding the Shift key + Right mouse button, the filter list will display on your mouse pointer position.
19 Interface customization

You can right mouse button click on the ribbon empty area, then you can see interface you customization command. Or can directly click the Customize... command from the Ribbon tab.

![Ribbon Appearance](image)

What you can customize?
You can add your own command.

![Customize](image)

Transfer the command between different ribbon tab, you can also create a new ribbon tab.
Customize the hotkey for CADbro.

Customize your mouse action, with this function below, you can customize CADbro mouse
actions to be the same as other 3D systems, this will make you easy to get used to working with CADbro.
20 Changing language

Click the Windows button, find the ZWSOFT folder and click the button Change Language.

Then you can choose one to change the installation language.
Chapter 21 Online Update

21 Online update

Click Windows button, find the ZWSOFT folder and click the button Check For updates.
22 Set File associations

Click Windows button, find the ZWSOFT folder and click the button Set File Associations.

Use this command you can set the formats to link with CADbro. When you double click on the format then it will default to open in CAD bro.
